## User Attributes

## Federation Id

**Full Formal Name:** gfipm:2.0:user:FederationId

**Short Formal Name:** FederationId

**Data Type:** Text

**Metadata Version:** 2.0

**Definition:** The persistent, federation-unique identifier for the user, comprising a federation part, an optional trusted identity broker (TIB) part, an identity provider (IDP) part, and a local ID. All parts of the identifier are delimited by colons. The general format of a federation ID for a user is: “Federation:[TIB:TIB:]IDP:IDP:USER:User ID”.

Federation is required, and is a globally unique federation identifier. It must contain only alphanumeric characters and dashes. Federation identifiers are managed via the GFIPM Federation Name Registry. Information about this registry is available at the following URL.

<http://gfipm.net/fed-registry.html>

“TIB” and TIB are required only for identities asserted by trusted identity brokers. TIB must uniquely identify a trusted identity broker within the federation. It must contain only alphanumeric characters and dashes.

“IDP” and IDP are required. If preceded by a TIB part, IDP must uniquely identify an identity provider that is brokered by the TIB within the federation. If not preceded by a TIB identifier, IDP must uniquely identify an identity provider that is NOT brokered by a TIB within the federation. IDP must contain only alphanumeric characters and dashes.

“USER” and User ID are required, and must uniquely identify a user from the identity provider indicated in the IDP part. The format of User ID is undefined, and is intended to match the format in which the IDP stores local user IDs. Typical format choices may include email address or X.509 common name.

## Identity Provider Id

**Full Formal Name:** gfipm:2.0:user:IdentityProviderId

**Short Formal Name:** IdentityProviderId

**Data Type:** Text

**Metadata Version:** 2.0

**Definition:** The unique identifier within the federation that identifies the identity provider (IDP) of the user within the federation. Comprises a federation part, an optional trusted identity broker (TIB) part, and an identity provider (IDP) part. The general format of an identity provider ID is: “Federation:[TIB:TIB:]IDP:IDP”.

Federation is required, and is a globally unique federation identifier. It must contain only alphanumeric characters and dashes. Federation identifiers are managed via the GFIPM Federation Name Registry. Information about this registry is available at the following URL.

<http://gfipm.net/fed-registry.html>

“TIB” and TIB are required only for identity providers that are brokered by a trusted identity broker. TIB must uniquely identify a trusted identity broker within the federation. It must contain only alphanumeric characters and dashes.

“IDP” and IDP are required. If preceded by a TIB part, IDP must uniquely identify an identity provider that is brokered by the TIB within the federation. If not preceded by a TIB identifier, IDP must uniquely identify an identity provider that is NOT brokered by a TIB within the federation. IDP must contain only alphanumeric characters and dashes.

## Local Weather Conditions

**Full Formal Name:** gfipm:2.0:environment:LocalWeatherConditions

**Short Formal Name:** LocalWeatherConditions

**Data Type:** Text

**Metadata Version:** 2.0

**Definition:** The prevailing local weather conditions within which an event occurs.

**Usage Information:** None Provided

**Example Content:** None Provided

**NIEM Xpath:** N/A

**NIEM Definition:** N/A

**Attribute Source:** GFIPM Delivery Team

**Misc. Notes:** This attribute is new as of version 2.0. It is currently free-form text, but it may be useful to make it a code set instead. Yahoo provides a robust set of weather condition codes as part of the Yahoo Developer Network. NIEM provides an “ITIS” weather conditions code set, but it appears to be incomplete. (It does not include any “severe” weather conditions, or even rainy conditions.) There is also a set of NTSB Weather Condition Codes; however, these codes are primarily geared towards weather conditions that would be encountered by aircraft, and are not generally applicable to ground-level weather conditions.

## SAML Electronic Identity Category Code

Value	Description
AuthenticatedTelephony	Principal has authenticated via the means of the line number, a user suffix, and a password element.
InternetProtocol	Principal has authenticated through the use of a provided IP address.
InternetProtocolPassword	Principal has authenticated through the use of a provided IP address, in addition to a username/password.
Kerberos	Principal has authenticated using a password to a local authentication authority, in order to acquire a Kerberos ticket. That Kerberos ticket is then used for subsequent network authentication.
MobileOneFactorContract	Reflects mobile contract customer registration procedures and a single factor authentication. For example, a digital signing device with tamper resistant memory for key storage, such as the mobile MSISDN, but no required PIN or biometric for real-time user authentication.
MobileOneFactorUnregistered	Reflects no mobile customer registration procedures and an authentication of the mobile device without requiring explicit end-user interaction. This context class authenticates only the device and never the user; it is useful when services other than the mobile operator want to add a secure device authentication to their authentication process.
MobileTwoFactorContract	Reflects mobile contract customer registration procedures and a two-factor based authentication. For example, a digital signing device with tamper resistant memory for key storage, such as a GSM SIM, that requires explicit proof of user identity and intent, such as a PIN or biometric.

MobileTwoFactorUnregistered	Reflects no mobile customer registration procedures and a two-factor based authentication, such as secure device and user PIN. This context class is useful when a service other than the mobile operator wants to link their customer ID to a mobile supplied two-factor authentication service by capturing mobile phone data at enrollment.
NomadTelephony	Principal is “roaming” (perhaps using a phone card) and has authenticated via the means of the line number, a user suffix, and a password element.
Password	Principal has authenticated to an authentication authority through the presentation of a password over an unprotected HTTP session.
PasswordProtectedTransport	Principal has authenticated to an authentication authority through the presentation of a password over a protected session.
PersonalizedTelephony	Principal has authenticated via the provision of a fixed-line telephone number and a user suffix, transported via a telephony protocol such as ADSL.
PGP	Principal has authenticated by means of a digital signature where the key was validated as part of a PGP Public Key Infrastructure.

PreviousSession	Applicable when a principal had authenticated to an authentication authority at some point in the past using any authentication context supported by that authentication authority. Consequently, a subsequent authentication event that the authentication authority will assert to the relying party may be significantly separated in time from the principal's current resource access request. The context for the previously authenticated session is explicitly not included in this context class because the user has not authenticated during this session, and so the mechanism that the user employed to authenticate in a previous session should not be used as part of a decision on whether to now allow access to a resource.
SecureRemotePassword	Principal has authenticated by means of Secure Remote Password as specified in RFC 2945.
Smartcard	Principal has authenticated to an authentication authority using a smartcard.
SmartcardPKI	Principal has authenticated to an authentication authority through a two-factor authentication mechanism using a smartcard with enclosed private key and a PIN.
SoftwarePKI	Principal has authenticated to an authentication authority using an X.509 certificate stored in software.
SPKI	Principal has authenticated by means of a digital signature where the key was validated via an SPKI Infrastructure.
Telephony	Principal has authenticated via the provision of a fixed-line telephone number, transported via a telephony protocol such as ADSL.
TimeSyncToken	Principal has authenticated through a time synchronization token.

TLSCient	Principal has authenticated by means of a client certificate, secured with the SSL/TLS transport.
Unspecified	Principal has authenticated via unspecified means.
X509	Principal authenticated by means of a digital signature where the key was validated as part of an X.509 Public Key Infrastructure.
XMLDSig	Principal has authenticated by means of a digital signature according to the processing rules specified in the XML Digital Signature specification.
